Projects

• PHISHING WEBSITES DETECTION USING MACHINE LEARNING ALGORITHMS

This computer vision project involves using machine learning algorithms to detect phishing websites. The project aims to train a model that can identify and classify whether a website is a legitimate or a phishing website based on its visual appearance. The project will involve gathering a dataset of website screenshots and their corresponding labels indicating whether they are phishing or legitimate websites. Then, the dataset will be preprocessed to extract relevant features, and a machine learning algorithm such as a convolutional neural network (CNN) will be trained to classify the websites. Finally, the trained model will be tested on a new set of website screenshots to evaluate its performance in detecting phishing websites.
